Large Volume Capacity Underground Tanks

CelluTank® is an easy to install, efficient and cost effective stormwater management system for residential, commercial and industrial projects.

CelluTank® is a modular, high strength underground infiltration or re-use stormwater tank. The modules provide an efficient at-source management system for rainwater from roofs and other impermeable surfaces such as parking areas, driveways, playgrounds and sports fields. The modules are manufactured in Australia from recycled plastics and contribute to environmental point credits on building projects.

ADVANTAGES OF CELLUTANK®

- ☒ Use under trafficable areas
- ☒ Large unit volume capacity
- ☒ Less panels to assemble compared to other products
- ☒ Fewer modules to install compared to alternative products
- ☒ Easy on-site assembly
- ☒ Interlock vertically
- ☒ Caters for insertion of base flushing pipe

CelluTank® modules are easily assembled on site by clipping together the high strength large interlocking panels, which reduces assembly time compared to competitive products. The large CelluTank® modules are easily handled and once positioned in-situ, produce greater stability compared to smaller competitive products. Assembled units can be interlocked vertically thus ensuring the system remains stable even under trafficable areas.

A 100,000 litre CelluTank® re-use system (above) being installed at Bailik College in Melbourne. Cellutank® modules are enveloped with a high strength membrane to contain stormwater. The system withstands the weight of heavy equipment (right). Stored stormwater will be used for toilets, to irrigate surrounding gardens and to supply a water feature which is positioned above the system.

A 50,000 litre Cellutank® underground water storage system (above) being installed at a private residence in Hawthorn Melbourne. Run-off stormwater from roof areas is stored within the modules and is used to irrigate surrounding landscaped areas.

CelluTank® stormwater tanks are available in several load-bearing capacities and cater for the requirement of individual houses up to the largest commercial and industrial developments. The load-bearing capacity is increased with the use of additional proprietary 'stabilisers'.
